## Habitat

Alpine newts are found in the high mountains of Europe, from the Pyrenees to the Alps and the Carpathians. They are typically found in alpine meadows, near ponds or streams. Alpine newts prefer cool, humid environments with plenty of hiding places. They are often found under rocks, logs, or in burrows.

## Diet

Alpine newts are carnivores and eat a variety of insects, worms, and other small invertebrates. They use their long, sticky tongues to capture their prey. Alpine newts are also known to eat eggs and larvae of other amphibians.

## Behavior

Alpine newts are shy and secretive creatures. They are most active during the night and spend the day hiding under rocks or logs. Alpine newts are territorial and will defend their territory against other newts. They are also known to be quite vocal and will use a variety of sounds to communicate with each other.

## Conservation Status

Alpine newts are a threatened species and are listed as such by the International Union for Conservation of Nature (IUCN). The main threats to alpine newts include habitat loss and pollution. Alpine newts are also susceptible to chytridiomycosis, a fungal disease that is killing amphibians around the world.

Alpine newts are fascinating creatures that are an important part of the high mountain ecosystem. They are a threatened species, but there are a number of things that can be done to help them. By protecting their habitat, reducing pollution, and controlling chytridiomycosis, we can help to ensure the survival of these amazing creatures.
