There are three main groups of amphibians: frogs, toads, and salamanders. Frogs and toads are similar in appearance, but frogs have smooth skin while toads have bumpy skin. Salamanders are long and slender, and they have tails.

Amphibians are found all over the world, but they are most common in warm, moist climates. They live in a variety of habitats, including ponds, lakes, rivers, streams, and forests.

Amphibians play an important role in the ecosystem. They are a food source for other animals, and they help to control the population of insects.

Amphibians are also sensitive to changes in the environment, so their presence can be an indicator of the health of an ecosystem.

What Are the Characteristics of Amphibians?

- **Amphibians can breathe through their skin.** This is because their skin is thin and moist, and it has a lot of blood vessels. The oxygen in the air dissolves in the water on the skin, and it is then absorbed into the bloodstream.
- **Amphibians lay their eggs in water.** The eggs are fertilized by the male, and they hatch into larvae. The larvae live in the water, and they breathe through gills.
- **When the larvae grow up, they metamorphose into adults.** The adults have lungs, and they can breathe air. They also have legs, and they can walk on land.

What Are Some Examples of Amphibians?

Some examples of amphibians include:

- Frogs
- Toads
- Salamanders
- Newts
- Caecilians

What Is the Importance of Amphibians?

Amphibians are important for a number of reasons:

- **They are a food source for other animals.** Amphibians are eaten by fish, birds, reptiles, and mammals.
- **They help to control the population of insects.** Amphibians eat insects, and this helps to keep the insect population under control.
- **They are sensitive to changes in the environment.** Amphibians are sensitive to changes in the water quality, temperature, and pH. Their presence can be an indicator of the health of an ecosystem.

Amphibians are a unique and important group of animals. They have a number of unique characteristics that allow them to live both in water and on land. Amphibians play an important role in the ecosystem, and they are sensitive to changes in the environment.
